

Cours 01-06 : Imprimer en Python

réf. <https://realpython.com/python-f-strings/#old-school-string-formatting-in-python>

= BUROTIX ()

"Old-school" formatting : %

- Pour information uniquement
- Exemple

```
name = "Eric"  
print("Hello, %s." % name)  
=>  
'Hello, Eric.'
```

Plus récent : str.format()

- Très bon mais verbeux
- Exemple

```
name = "Eric"
```

```
age = 74
```

```
print("Hello, {} ({}).".format(name, age) )
```

=>

```
'Hello, Eric (74).'
```

Plus récent : str.format()

- Variante, plus précise
- Exemple

```
name = "Eric"
```

```
age = 74
```

```
print("{1}? {0}!".format(age, name) )
```

=>

```
'Eric? 74!'
```

Forme moderne : f-string

- "formatted string literals"
- Exemple

```
name = "Eric"
```

```
age = 74
```

```
print(f"Hello, {name}. You are {age}.")
```

=>

```
'Hello, Eric. You are 74.'
```

Forme moderne : f-string

- fonctions ou méthodes d'objet appelables
- Exemple

```
name = "Eric"
```

```
age = 74
```

```
print(f"Hello, {name.upper()}")
```

```
=>
```

```
'Hello, ERIC.'
```
